There is a lot of exciting stuff going on in the stars above us that makes astronomy so much fun. The universe is constantly changing, moving. Some would say it’s a “living” thing because you never know what you are going to see on any given night of stargazing.

Of the many celestial phenomenons, there is probably none as exciting as when you see your first asteroid on the move in the heavens. To call asteroids the “rock stars” of astronomy is both a bad joke and an accurate depiction of how astronomy fans view them. Unlike suns, planets, and moons, asteroids are on the move, ever-changing, and, if they appear in the night sky, they are exciting and dynamic.
